

The most important change that was made to the entire project was the creation of a brand new external CSS stylesheet - style.css. The original code contained no external stylesheet at all, but instead used outdated methods of applying styling to each of the five pages of the website. For example, attributes like color, align, background and the old font tag were all used in the original code to set the font colours, background colours, text alignment and font choices for the website.

The new stylesheet, however, uses a colour system based on CSS variables where all of the colours (including the gold colour, the black colour, and every shade of colour in between) are defined once at the very top of the stylesheet, and then referenced throughout the entire project. The chosen colours are primarily a warm rich gold colour and near pure deep black colour. A slightly lighter black colour is used for the background colours for the product cards, and a dark grey colour is used for the colour of all secondary text on the website to ensure it does not compete with the main white text.

Three different Google Fonts were also introduced as a replacement for the Aptos font that was present in the original code. Aptos is a font that is used within Microsoft Office applications but does not ever load into a web browser by any visitor of the website. The three different fonts that were used in the new stylesheet are Bebas Neue for the largest display headings on the website, Oswald for the subheadings and navigation links on the website, and Lato for all body text that was present in the website. The navigation bar for the website was also completely restyled. In the original code for the website, the navigation links were bright blue on a black background, which contrasted poorly with the theme of the website that used gold and black colours. Instead, the links are grey in colour and only turn to gold when the user either hovers over a navigation link or if the link represents the current page that the user is browsing on the website. Additionally, a thin underline of gold colour appears under the navigation link when the user hovers over that link. Finally, the navigation bar itself has been made sticky so that it remains at the top of the screen even as the user scrolls down the website's pages.

The Home page for the website had some structural problems. For instance, there were two different header and navigation bar elements that were both rendered by the browser. One of the headers existed as a result of the previous styling attempt for the website, while the other header was the inline styled header element that was used across the other pages of the website. Both of these headers have been removed and replaced with a single header for the home page. Additionally, there was an empty section within the home page as a result of the previous styling attempt for the website. This section used the HTML <h2> tag but contained no text within the header element. This element has been deleted from the website. Finally, the copyright symbol within the footer of the website was incorrectly typed as a colon instead of a semicolon. This symbol has been corrected on every single page of the website.

The About Us page had one stray quotation mark in the middle of the page's HTML code, right after the navigation heading's closing tag. This error has been corrected. The main image within the About Us page was incorrectly set to 1500 pixels in width which would cause a horizontal scroll bar to appear on all screens when browsing the site. Additionally, there were two grammatical errors in the text within the About Us page; the word organisation did not have an apostrophe, and the word dont did not have an apostrophe either. Both of these errors have been corrected.

The Product page had a typo within the file name for one of its product images; the sixth product image was named Prodcuts instead of Products. The footer for this page was also outside the body tag which is invalid HTML code; it has been corrected.

The Sessions page had an incorrectly opened font tag within the page's content; this tag was never closed. In addition, the list element for the sessions had been replaced by a table element.

The Contact Details page also had a few errors. For instance, the opening HTML tag also contained a stray quotation mark which is invalid HTML code. Additionally, the Google Maps element was incorrectly embedded within an unordered list element which is invalid HTML code; it has been corrected.

Finally, each of the pages had its font tags removed (since the font tag is no longer a part of the HTML standard), its align attribute within the body tag removed, its background attribute within the body tag removed, the inline colour attribute for each of its elements removed, and each of its pages also had a proper viewport meta tag added to each of the pages' HTML elements which ensures that the website scales appropriately on mobile devices.
